

RICE Score = (Reach × Impact × Confidence) ÷ Effort

Higher score = higher priority · Developed by Intercom to bring objectivity to product prioritisation
Score problems from your research interviews — up to 8 maximum

R — Reach

How many people (customers + staff) does this problem affect each day? Enter the number.

I — Impact

3 = Massive · 2 = High · 1 = Medium
0.5 = Low · 0.25 = Minimal

C — Confidence

1.0 = High — data backs this up
0.8 = Medium — mostly evidence
0.5 = Low — mostly instinct

E — Effort

Estimated months to resolve:
0.5 = 2 weeks · 1 = 1 month
2 = 2 months · 3 = full quarter

RICE SCORING TABLE — COMPLETE FOR EACH PROBLEM IDENTIFIED IN YOUR RESEARCH

#	Problem Statement (one sentence)	Reach (people/day)	Impact (0.25 / 0.5 / 1 / 2 / 3)	Confidence (0.5 / 0.8 / 1.0)	Effort (months)	RICE Score (R×I×C)÷E	Priority Rank
1							
2							
3							
4							
5							
6							
7							
8							

Instructions: (1) Describe each problem in one clear sentence. (2) Estimate Reach, Impact, Confidence and Effort using the scales above. (3) Calculate RICE Score = (R × I × C) ÷ E. (4) Rank problems highest to lowest. (5) Look for clusters — problems with similar scores may share a common root cause that one intervention could solve.
