

RICE Score = (Reach × Impact × Confidence) ÷ Effort

Higher score = higher priority · Developed by Intercom · Reach = people affected per day · Effort = months to resolve

Model answers below — participants may reasonably differ. Focus debrief on REASONING, not exact numbers.

R — Reach

People (customers + staff) affected per day. Use ~250 for all-customer problems; lower for specific sub-groups.

I — Impact

3 = Massive · 2 = High · 1 = Medium
0.5 = Low · 0.25 = Minimal

C — Confidence

1.0 = High — data backs this up
0.8 = Medium — mostly evidence
0.5 = Low — mostly instinct / future horizon

E — Effort

0.5 = 2 weeks · 1 = 1 month
2 = 2 months · 3 = full quarter
A1 features ≈ 1 month · A2 supply chain ≈ 3 months

RICE SCORING TABLE — MODEL ANSWER

#	Problem Statement	Reach people/day	Impact 0.25-3	Confidence 0.5/0.8/1.0	Effort months	RICE Score	Rank	Facilitator Note
1	Handwritten chits cause order errors downstream	250	2	0.8	1	400	1st	All 250 daily customers at risk. Resolved by A1 digital ordering.
2	No pre-ordering creates 15-30 min peak queues	250	2	0.8	1	400	1st	Same reach and effort as #1 — same A1 intervention resolves both.
3	Memory-based collection leads to wrong drinks given out	250	2	0.8	1	400	1st	Ticket system (part of A1) resolves. John's memory no longer sole mechanism.
4	No customer notification — customers hover or miss collection	250	1	0.8	0.5	400	1st	Low effort (SMS/push = 0.5 months) brings score up despite medium impact.
5	Single barista bottleneck — Darren prepares every drink alone	250	2	0.8	2	200	5th	Higher effort (2 months) halves score. Digital display reduces chit interruptions (partial fix).
6	Paper loyalty stamp cards frequently lost or forgotten	100	1	0.8	0.5	160	6th	Reach drops to ~100 (loyalty customers only). Digital loyalty in A1 resolves.
7	Bulk order confusion — wrong drinks labelled or distributed to team	50	2	0.8	0.5	160	6th	Reach = ~50 (bulk buyers like Jacky). Per-person labelling in A1 resolves.
8	Supply chain can't scale — manual ordering won't support two outlets	150	3	0.5	3	75	8th	Low confidence (future/structural) + high effort = lowest RICE. Requires A2. C1 accepts this as Year 2 upgrade.

Key debrief insight: Problems 1-4 all score 400 — identical RICE scores signal a shared root cause. A single digital order flow intervention (Scenario A1) resolves all four simultaneously. · Supply chain (#8) scores lowest not because it is unimportant, but because it is structural (low confidence) and high-effort (requires A2). RICE teaches participants to sequence it later, not ignore it.
